**Scope and Objectives**

In recent years, there have been a number of collapse cases for roof structures in various parts of the world including the ones in U.K., Russia, Poland and Germany. While most of the collapses are related to snow loads, some of them can be due to other loads including rainstorm. The main complexity in the design of this type of structures is due to the uncertainty in assuming correctly the effective length factor and in checking of snap-through buckling. Local consultants may be required to design steel structures in cold area in China and against heavy rainstorm locally. This seminar discusses about the design of roof structures using the performance-based design. The second-order nonlinear analysis method studied by the team of the speakers over the past few years is introduced and proposed for the design of this type of structural forms.
